

I can guide you step by step on **installing Dev C++ on Windows 11** and configuring the compiler so you can run C++ programs smoothly. Let's go through it carefully.

Step 1: Download Dev C++

1. Go to the official Dev C++ website: <https://sourceforge.net/projects/orwelldvcpp/>
2. Click **Download**. You'll get an **.exe** installer (usually named something like **Dev-Cpp-2022.exe**).

⚠ Make sure to download the **latest version**, which comes with the GCC compiler built-in. This avoids separate compiler configuration.

Step 2: Install Dev C++

1. Run the downloaded **.exe** file.
 2. Follow the installation wizard:
 - Click **Next** on welcome screen.
 - Choose installation location (default is fine, e.g., **C:\Program Files\Dev-Cpp**).
 - Click **Next** and **Install**.
 3. Wait for the installation to complete and click **Finish**.
-

Step 3: Launch Dev C++

1. Open **Dev C++** from Start Menu or desktop shortcut.
 2. You should see the main IDE window.
-

Step 4: Configure the Compiler (if needed)

Newer Dev C++ versions usually include MinGW GCC compiler. But if your installation doesn't detect the compiler:

1. Go to **Tools** → **Compiler Options** → **Compiler Settings** → **Executables**.
 2. Check the **Compiler's installation directory** path:
 - Default: **C:\Program Files\Dev-Cpp\MinGW64** (or similar).
 3. Make sure the following executables exist in **bin** folder inside the compiler directory:
 - **gcc.exe**
 - **g++.exe**
 - **gdb.exe** (optional for debugging)
 4. If not, you may need to **download MinGW** separately and set the path.
-

Step 5: Test the Compiler

1. Open Dev C++ → **File** → **New** → **Source File**.
2. Write a simple program:

```
#include <iostream>
using namespace std;

int main() {
    cout << "Hello, World!" << endl;
    return 0;
}
```

3. Save the file as **hello.cpp**.
4. Click **Execute** → **Compile & Run** (or press **F11**).
5. You should see a console window displaying:

Hello, World!

✓ If this works, your Dev C++ installation and compiler are properly configured.

Optional Step 6: Set Environment Variable (for command-line use)

If you want to compile programs using Command Prompt:

1. Add the path to the **bin** folder of your MinGW compiler to **Windows PATH**:
 - Right-click **This PC** → **Properties** → **Advanced system settings** → **Environment Variables** → **Path** → **Edit** → **New** → **Paste path to bin**.
 - Example: **C:\Program Files\Dev-Cpp\MinGW64\bin**
2. Open Command Prompt and type:

```
g++ --version
```

You should see the GCC version.
